Research Interest

My research interest is in the intersection of cybersecurity, formal verification and programming languages. I hope to formally verify the security properties of real-life programs, ideally executable code, so programmers implementing cryptographic protocols can be confident that the resulting code achieves the security specifications. I believe in the power of security by design, and programming language theory, supported by rigorous mathematical foundations, is a promising way towards the goal. I hope to study how to design programming languages that are expressive enough for specific domains and produce compiled results that are amenable to computer-aided formal verification.

Education

Bachelor of Arts in Computer Science 2019 - 2022
University of Oxford, United Kingdom
First Class Honours
Cohort ranking: 1/43

Research Experience

Research Engineer in Cybersecurity 2022 - Present
Agency for Science, Technology and Research, Singapore
I have developed a Python library for compressing layers of an artificial neural network so that it requires a smaller multiplicative depth when evaluated in homomorphic encryption; I am working on a project to apply homomorphic encryption to machine learning.

Final-Year Project in Robustness Evaluation of Attention Neural Networks 2021 - 2022
University of Oxford, United Kingdom
I trained neural network models with attention mechanisms based on existing literature and evaluated their robustness. I found evidence suggesting that attention neural networks for image classification may not be more robust than models without attention mechanisms.

Summer Attachment in Lattice-Based Cryptography 2021
Agency for Science, Technology and Research, Singapore
I learnt about the mathematical problems underlying lattice-based cryptography, studied a paper on lattice signatures and gave a presentation about the paper.

Research attachment in Computational Biology 2017 - 2018
Agency for Science, Technology and Research, Singapore
I designed and conducted experiments to collect electroencephalogram (EEG) signals of subjects while they perform mental arithmetic, and I trained a machine learning model to distinguish mental arithmetic difficulty levels based on the EEG signals.

Achievements and Awards

National Science Scholarship (BS-PhD) 2019 - Present
Awarded by Agency for Science, Technology and Research, Singapore

Hoare Prize 2022
For the best overall performance in Computer Science 2022
Awarded by Department of Computer Science, University of Oxford, United Kingdom

Book Prizes 2020, 2021
For two first-class vacation essays and performance in a few assessments
Awarded by St Catherine's College, University of Oxford, United Kingdom

College Scholarship 2020
For the performance in the end-of-year assessments in Computer Science
Awarded by St Catherine's College, University of Oxford, United Kingdom

Silver Award 2018
For the paper and the poster presentation at Singapore Science and Engineering Fair 2018
